Supervised Learning of the supervised Learning Conference Learnin

## Supervised Learning: Recap

- Given: a set of data points (or attributes)  $\{x^{(1)},x^{(2)},...,x^{(m)}\}$  and their associated labels  $\{y^{(1)},y^{(2)},...,y^{(m)}\}$
- ullet Dimensions: x usually d-dimensional  $\in \mathbb{R}^d$ , y typically scalar
- ullet Goal: build a model that predicts y from x for unseen x

# Supervised Learning: Recap

### Types of predictions

- y is continuous, real-valued: Regression
- Example: Linear regression
- y is discrete classes: Classification
- Example: Logistic regression, SVM, Naive Bayes

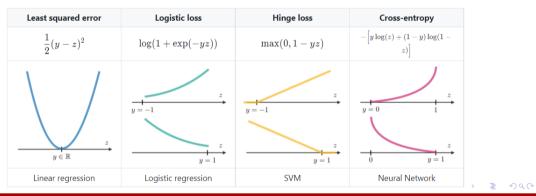

## Supervised Learning: Recap

### Types of models

- Discriminative
- Directly estimate p(y|x) by learning decision boundary
- Example: Logistic regression, SVM
- Generative
- Models the joint distribution p(x, y)
- Estimate p(x|y) and infer p(y|x) from it
- Can generate new samples
- Example: GDA, Naive Bayes

## **Notations and Concepts**

- **Hypothesis**: Denoted by  $h_{\theta}$ . Given an input  $x^{(i)}$ , predicted output is  $h_{\theta}(x^{(i)})$
- Loss Function: Function  $L(z,y): \mathbb{R} \times \mathbb{Y} \mapsto \mathbb{R}$  computes how different the predicted value z and the ground truth label are

CS229 Midterm Review Fall 2022

Nandita Bhaskhar

## **Notations and Concepts**

• Cost function: Function J taking model parameters  $\theta$  as input and giving a score to reflect how badly the model performs. Sum of loss over all predictions

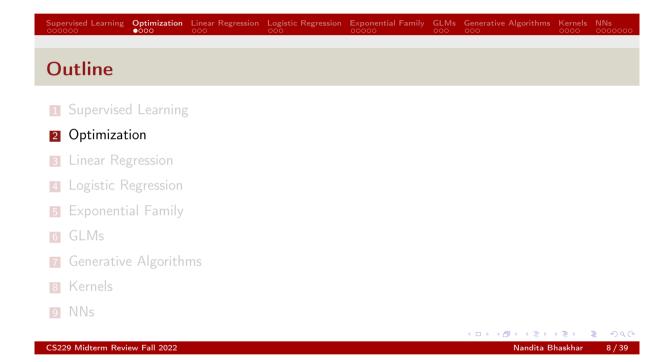

$$J(\theta) = \sum_{i=1}^{m} L(h_{\theta}(x^{(i)}), y^{(i)})$$

• **Likelihood**: Maximizing likelihood  $L(\theta)$  corresponds to finding the "best" distribution of data given a set of parameters. We usually find the log likelihood  $\ell(\theta) = \log L(\theta)$  and maximize it.

$$heta^* = \operatorname{argmax}_{ heta} \ell( heta)$$

◆□▶◆圖▶◆臺▶◆臺▶ 臺 釣Q@

CS229 Midterm Review Fall 2022

## **Optimization: Gradient Descent**

• To find the optimal  $\theta$  that minimizes the cost function  $J(\theta)$ , we can use gradient descent with a learning rate  $\alpha \in \mathbb{R}$ 

$$\theta^{(t+1)} = \theta^{(t)} - \alpha \nabla_{\theta} J(\theta^{(t)})$$

#### Stochastic Gradient Descent

• In Stochastic gradient descent (SGD), we update the parameter based on **each** training example, whereas in batch gradient descent we update based on a batch of training examples.

◆ロ > ◆母 > ◆ き > ◆き > き め Q @

## Optimization: Newton's method

- Numerical method to estimate  $\theta$  such that  $J'(\theta)$  is 0
- ullet We update heta as follows:

$$\theta^{(t+1)} = \theta^{(t)} - \frac{J'(\theta^{(t)})}{J''(\theta^{(t)})}$$

• For the multi-dimensional case:

$$\theta^{(t+1)} = \theta^{(t)} - \left[\nabla_{\theta}^2 J(\theta^{(t)})\right]^{-1} \nabla_{\theta} J(\theta^{(t)})$$

## Recap: Gradients and Hessians

ullet Gradient and Hessian (differentiable function  $f:\mathbb{R}^d\mapsto\mathbb{R}$ )

$$\nabla_{x} f = \begin{bmatrix} \frac{\partial f}{\partial x_{1}} & \dots & \frac{\partial f}{\partial x_{d}} \end{bmatrix}^{T} \in \mathbb{R}^{d}$$

$$\nabla_{x}^{2} f = \begin{bmatrix} \frac{\partial^{2} f}{\partial x_{1}^{2}} & \dots & \frac{\partial^{2} f}{\partial x_{1} \partial x_{d}} \\ \vdots & \ddots & \vdots \\ \frac{\partial^{2} f}{\partial x_{d} \partial x_{1}} & \dots & \frac{\partial^{2} f}{\partial x_{d}^{2}} \end{bmatrix} \in \mathbb{R}^{d \times d}$$

### **Linear Regression**

- Model:  $h_{\theta}(x) = \theta^T x$
- ullet Training data:  $\left\{\left(x^{(i)},y^{(i)}
  ight)
  ight\}_{i=1}^{n}$ ,  $x^{(i)}\in\mathbb{R}^{d}$
- Loss:  $J(\theta) = \frac{1}{2} \sum_{i=1}^{n} (h_{\theta}(x^{(i)}) y^{(i)})^2$
- Update rule:

$$\theta^{(t+1)} = \theta^{(t)} - \alpha \sum_{i=1}^{n} \left( h_{\theta}(x^{(i)}) - y^{(i)} \right) x^{(i)}$$

### Stochastic Gradient Descent (SGD)

Pick one data point  $x^{(i)}$  and then update:

$$\theta^{(t+1)} = \theta^{(t)} - \alpha \left( h_{\theta}(x^{(i)}) - y^{(i)} \right) x^{(i)}$$

## Solving Least Squares: Closed Form

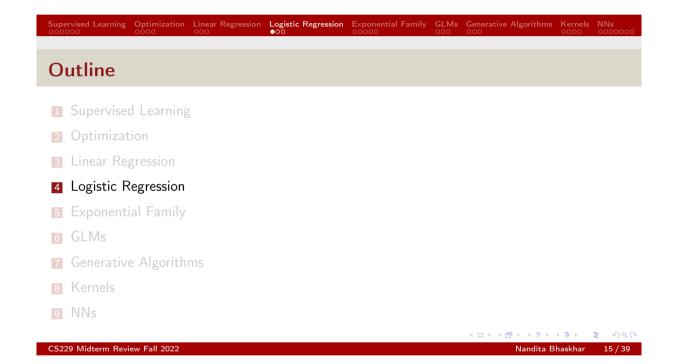

- Loss in matrix form:  $J(\theta) = \frac{1}{2} \|X\theta y\|_2^2$ , where  $X \in \mathbb{R}^{n \times d}$ ,  $y \in \mathbb{R}^n$
- Normal Equation (set gradient to 0):

$$X^{T}\left(X\theta^{\star}-y\right)=0$$

• Closed form solution:

$$\theta^{\star} = \left(X^{T}X\right)^{-1}X^{T}y$$

## Logistic Regression

A binary classification model and  $y^{(i)} \in \{0, 1\}$ 

• Assumed model:

$$p\left(y\mid x;\theta\right) = \begin{cases} g_{\theta}\left(x\right) & \text{if } y=1\\ 1-g_{\theta}\left(x\right) & \text{if } y=0 \end{cases}, \quad \text{where } g_{\theta}\left(x\right) = \frac{1}{1+e^{-\theta^{T}x}}$$

• Log-likelihood function:

$$\ell(\theta) = \sum_{i=1}^{n} \log p(y^{(i)} \mid x^{(i)}; \theta)$$

$$= \sum_{i=1}^{n} \left[ y^{(i)} \log g_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log(1 - g_{\theta}(x^{(i)})) \right]$$

• Find parameters through maximizing log-likelihood,  $\operatorname{argmax}_{\theta} \ell(\underline{\theta})$  (in Pset1),

## Sigmoid and Softmax

• Sigmoid: The sigmoid function (also known as logistic function) is given by:

$$g(z) = \frac{1}{1 + e^{-z}}$$

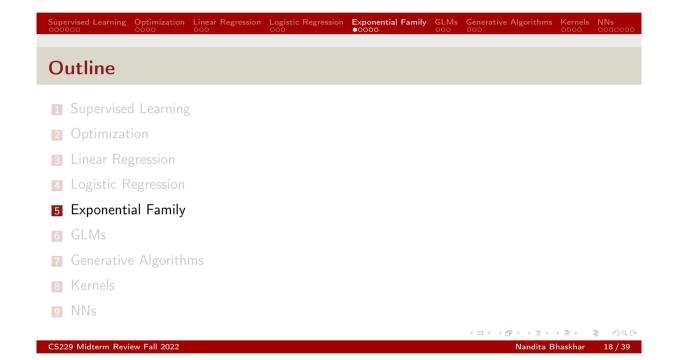

• Derivative of sigmoid:

$$g(z)(1-g(z))$$

• Softmax regression: Also called as multi-class logistic regression, it generalizes logistic regression to multi-class cases

$$p(y = k|x; \theta) = \frac{\exp \theta_k^T x}{\sum_j \exp \theta_j^T x}$$

Supervised Learning Optimization Condition Con

## **Exponential Family**

### Definition

Probability distribution with natural or canonical parameter  $\eta$ , sufficient statistic T(y) and a log-partition function  $a(\eta)$  whose density (or mass function) can be written as

$$p(y; \eta) = b(y) \exp \left(\eta^T T(y) - a(\eta)\right)$$

- Oftentimes, T(y) = y
- In many cases,  $\exp(-a(\eta))$  can be considered as a normalization term that makes the probabilities sum to one

## **Common Exponential Distributions**

Bernoulli distribution:

$$p(y;\phi) = \phi^{y} (1-\phi)^{1-y} = \exp\left(\left(\log\left(\frac{\phi}{1-\phi}\right)\right)y + \log(1-\phi)\right)$$

$$\implies b(y) = 1, \quad T(y) = y, \quad \eta = \log\left(\frac{\phi}{1-\phi}\right), \quad a(\eta) = \log(1+e^{\eta})$$

### More examples:

Categorical distribution, Poisson distribution, Multivariate normal distribution, etc

Supervised Learning Optimization Linear Regression Logistic Regression Supervised Learning Optimization Linear Regression Logistic Regression Optimization Optimi

## Common Exponential Distributions

Distribution	η	T(y)	$a(\eta)$	b(y)
Bernoulli	$\log\left(rac{\phi}{1-\phi} ight)$	y	$\log(1+\exp(\eta))$	1
Gaussian	$\mu$	y	$\frac{\eta^2}{2}$	$\frac{1}{\sqrt{2\pi}}\exp\left(-\frac{y^2}{2}\right)$
Poisson	$\log(\lambda)$	y	$e^{\eta}$	$\frac{1}{y!}$
Geometric	$\log(1-\phi)$	y	$\log\left(rac{e^{\eta}}{1-e^{\eta}} ight)$	1

◆ロト ◆母 ト ◆ 恵 ト ◆ 恵 ・ 夕 ♀ ○

## **Properties**

- $\mathbb{E}\left[T\left(Y\right);\eta\right] = \nabla_{\eta}a(\eta)$
- $Var(T(Y); \eta) = \nabla_{\eta}^{2}a(\eta)$

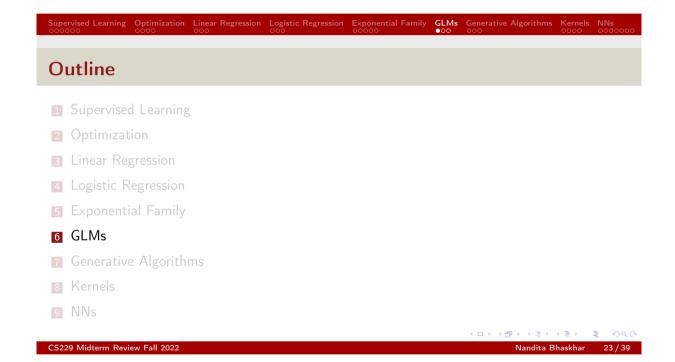

### Non-exponential Family Distribution

Uniform distribution over interval [a, b]:

$$p(y; a, b) = \frac{1}{b-a} \cdot 1_{\{a \le y \le b\}}$$

Reason: b(y) cannot depend on parameter  $\eta$ .

## Generalized Linear Model (GLM)

Generalized Linear Models (GLM) aim at predicting a random variable y as a function of x and rely on the following components:

Assumed model:

$$p(y \mid x; \theta) \sim \text{ExponentialFamily}(\eta)$$

- $\eta = \theta^T x$
- Predictor:  $h(x) = \mathbb{E}[T(Y); \eta] = \nabla_{\eta} a(\eta)$ .
- Fitting through maximum likelihood:

$$\max_{\theta} \ell(\theta) = \max_{\theta} \sum_{i=1}^{n} p(y^{(i)} \mid x^{(i)}; \eta)$$

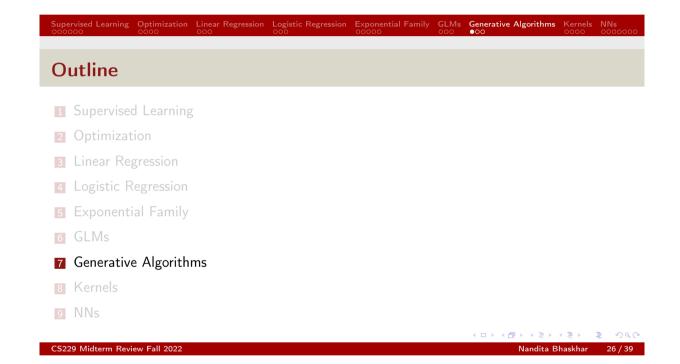

Supervised Learning occord Commitment Commi

## Generalized Linear Model (GLM)

### **Examples**

- GLM under Bernoulli distribution: Logistic regression
- GLM under Poisson distribution: Poisson regression (in Pset1)
- GLM under Normal distribution: Linear regression
- GLM under Categorical distribution: Softmax regression

40.40.45.45. 5 000

## Gaussian Discriminant Analysis (GDA)

### Generative Algorithm for Classification

- Learn p(x | y) and p(y)
- Classify through Bayes rule:  $\operatorname{argmax}_{v} p(y \mid x) = \operatorname{argmax}_{v} p(x \mid y) p(y)$

#### **GDA** Formulation

- Assume  $p(x \mid y) \sim \mathcal{N}(\mu_v, \Sigma)$  for some  $\mu_v \in \mathbb{R}^d$  and  $\Sigma \in \mathbb{R}^{d \times d}$
- Estimate  $\mu_y$ ,  $\Sigma$  and p(y) through maximum likelihood, which is

$$\operatorname{argmax} \sum_{i=1}^{n} \left[ \log p(x^{(i)} \mid y^{(i)}) + \log p(y^{(i)}) \right]$$

$$p(y) = \frac{\sum_{i=1}^{n} 1_{\{y^{(i)} = y\}}}{n}, \mu_y = \frac{\sum_{i=1}^{n} 1_{\{y^{(i)} = y\}} x^{(i)}}{\sum_{i=1}^{n} 1_{\{y^{(i)} = y\}}}, \Sigma = \frac{1}{n} \sum_{i=1}^{n} (x^{(i)} - \mu_{y^{(i)}}) (x^{(i)} - \mu_{y^{(i)}})^T$$

### **Naive Bayes**

#### **Formulation**

- Assume  $p(x \mid y) = \prod_{j=1}^{d} p(x_j \mid y)$
- Estimate  $p(x_j | y)$  and p(y) through maximum likelihood, which gives

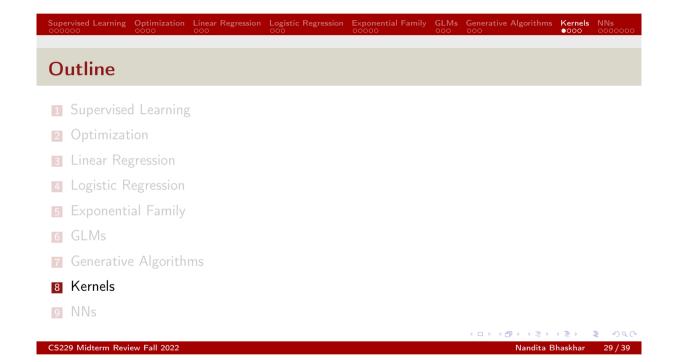

$$p(x_j \mid y) = \frac{\sum_{i=1}^{n} 1_{\{x_j^{(i)} = x_j, y^{(i)} = y\}}}{\sum_{i=1}^{n} 1_{\{y^{(i)} = y\}}}, \quad p(y) = \frac{\sum_{i=1}^{n} 1_{\{y^{(i)} = y\}}}{n}$$

### **Laplace Smoothing**

Assume  $x_j$  takes value in  $\{1,2,\ldots,k\}$ , the corresponding modified estimator is

$$p(x_j \mid y) = \frac{1 + \sum_{i=1}^{n} 1_{\{x_j^{(i)} = x_j, y^{(i)} = y\}}}{k + \sum_{i=1}^{n} 1_{\{y^{(i)} = y\}}}$$

### Kernel

- ullet Core idea: reparametrize parameter heta as a linear combination of featurized vectors
- Feature map:  $\phi : \mathbb{R}^d \mapsto \mathbb{R}^p$
- Fitting linear model with gradient descent gives us

$$\theta = \sum_{i=1}^{n} \beta_i \phi(x^{(i)})$$

• Predict a new example z:

$$h_{\theta}(z) = \sum_{i=1}^{n} \beta_{i} \phi(x^{(i)})^{T} \phi(z) = \sum_{i=1}^{n} \beta_{i} K(x^{(i)}, z)$$

• It brings nonlinearity without much sacrifice in efficiency as long as  $K(\cdot,\cdot)$  can be computed efficiently 4□ > 4□ > 4 = > 4 = > = 990

### Kernel

• Given a feature mapping  $\phi$ , we define the kernel K as follows:

$$K(x,z) = \phi(x)^T \phi(z)$$

- "Kernel trick" to compute the cost function using the kernel because we actually don't need to know the explicit mapping  $\phi$ , which is often very complicated
- Instead, only the values K(x, z) are needed
- Suppose  $K(x^{(i)}, x^{(j)}) = K_{ii}$
- If  $K = \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$  then is K a valid kernel function?
- If  $K = \begin{bmatrix} 3 & 5 \\ 5 & 3 \end{bmatrix}$  then is K a valid kernel function?

### Kernel

### Theorem

K(x,z) is a valid kernel if and only if for any set of  $\{x^{(1)},\ldots,x^{(n)}\}$ , its Gram matrix, defined as

$$G = \begin{bmatrix} K(x^{(1)}, x^{(1)}) & \dots & K(x^{(1)}, x^{(n)}) \\ \vdots & \ddots & \vdots \\ K(x^{(n)}, x^{(1)}) & \dots & K(x^{(n)}, x^{(n)}) \end{bmatrix} \in \mathbb{R}^{n \times n}$$

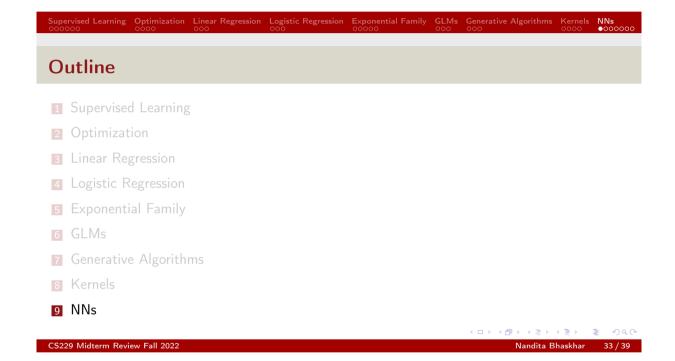

is positive semi-definite.

### **Examples**

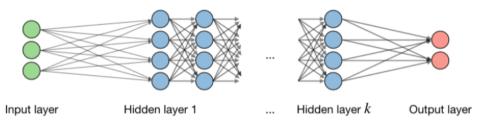

ullet Polynomial kernels:  $K\left(x,z
ight)=\left(x^{T}z+c
ight)^{d}$ ,  $\forall~c\geq0$  and  $d\in\mathbb{N}$ 

• Gaussian kernels:  $K(x,z) = \exp\left(-\frac{\|x-z\|_2^2}{2\sigma^2}\right)$ ,  $\forall \sigma^2 > 0$ 

4 D > 4 B > 4 B > 4 B > 9 Q (

## **Neural Networks**

By noting i the  $i^{th}$  layer of the network and j the  $j^{th}$  hidden unit of the layer, we have:

$$\boxed{z_j^{[i]} = {w_j^{[i]}}^T x + b_j^{[i]}}$$

where we note w, b, z the weight, bias and output respectively.

4□ > 4□ > 4 = > 4 = > = 990

CS229 Midterm Review Fall 2022

## **Neural Networks**

Multi-layer Fully-connected Neural Networks (with Activation Function f)

$$a^{[1]} = f\left(W^{[1]}x + b^{[1]}\right)$$

$$a^{[2]} = f\left(W^{[2]}a^{[1]} + b^{[2]}\right)$$

$$\dots$$

$$a^{[r-1]} = f\left(W^{[r-1]}a^{[r-2]} + b^{[r-1]}\right)$$

$$h_{\theta}(x) = a^{[r]} = W^{[r]}a^{[r-1]} + b^{[r]}$$

## **Activation Functions**

Sigmoid	Tanh	ReLU	Leaky ReLU
$g(z) = \frac{1}{1+e^{-z}}$	$g(z)=rac{e^z-e^{-z}}{e^z+e^{-z}}$	$g(z) = \max(0, z)$	$g(z) = \max(\epsilon z, z)$ with $\epsilon \ll 1$
$\begin{array}{c} 1 \\ \hline \frac{1}{2} \\ \hline -4 & 0 \end{array}$	1 -4 0 4 4 -1 -1 -1 -1 -1 -1 -1 -1 -1 -1 -1 -1 -1	0 1	0 1

- Step 1: Take a batch of training data
- Step 2: Perform forward propagation to obtain the corresponding loss
- Step 3: Backpropagate the loss to get the gradients
- Step 4: Use the gradients to update the weights of the network

4□ > 4圖 > 4 臺 > 4 臺 > ■ 9Q@

### **Backpropagation**

Let J be the loss function and  $z^{[k]} = W^{[k]}a^{[k-1]} + b^{[k]}$ . By chain rule, we have

$$\frac{\partial J}{\partial W_{ij}^{[r]}} = \frac{\partial J}{\partial z_{i}^{[r]}} \frac{\partial z_{i}^{[r]}}{\partial W_{ij}^{[r]}} = \frac{\partial J}{\partial z_{i}^{[r]}} a_{j}^{[r-1]} \implies \frac{\partial J}{\partial W^{[r]}} = \frac{\partial J}{\partial z^{[r]}} a^{[r-1]T}, \quad \frac{\partial J}{\partial b^{[r]}} = \frac{\partial J}{\partial z^{[r]}}$$

$$\frac{\partial J}{\partial a_{i}^{[r-1]}} = \sum_{j=1}^{d_{r}} \frac{\partial J}{\partial z_{j}^{[r]}} \frac{\partial z_{j}^{[r]}}{\partial a_{i}^{[r-1]}} = \sum_{j=1}^{d_{r}} \frac{\partial J}{\partial z_{j}^{[r]}} W_{ji}^{[r]} \implies \frac{\partial J}{\partial a^{[r-1]}} = W^{[r]T} \frac{\partial J}{\partial z^{[r]}}$$

$$\frac{\partial J}{\partial z^{[r]}} := \delta^{[r]} \implies \frac{\partial J}{\partial z^{[r-1]}} = \left(W^{[r]T} \delta^{[r]}\right) \odot f'\left(z^{[r-1]}\right) := \delta^{[r-1]}$$

$$\implies \frac{\partial J}{\partial W^{[r-1]}} = \delta^{[r-1]} a^{[r-2]T}, \quad \frac{\partial J}{\partial b^{[r-1]}} = \delta^{[r-1]}$$

Continue for layers  $r - 2, \ldots, 1$ .
